### Algebra EOC Practice Test #2

To calculate that constant, divide the coefficient of the x-term (which is -12) by 2 (giving -6) and square the result  $(-6)^2 = 36$ . Adding 36 to both sides of the original equation will complete the square: notice that  $x^2 - 12x + 36$  is indeed a perfect square trinomial because it can be factored as  $(x - 6)^2$ .

Algebra Here is a list of all of the skills that cover algebra! These skills are organized by grade, and you can move your mouse over any skill name to preview the skill. To start practicing, just click on any link. IXL will track your score, and the questions will automatically increase in difficulty as you improve!

### IXL | Learn algebra

First, let us find a common denominator to simplify the expression. The least common multiplier of 4 and 7 is 28. Then,  $\frac{7(x - 2)}{28} - \frac{4(3x + 5)}{28} = -\frac{3}{28}$ . Since both sides are written on the denominator 28 now, we can eliminate them:  $7(x - 2) - 4(3x + 5) = -84$ .  $7x - 14 - 12x - 20 = -84 - 5x = -84 + 14 + 20$
