Newtonian fluids, such as water or oil, are characterized by a viscosity (i.e. the ratio between shear stress and shear rate) that is independent of shear rate. These fluids display a linear relation between shear stress and shear rate. The only parameter needed to describe the model is the slope of the shear stress-shear rate relationship (Figure 7.4).

Well logging, also known as borehole logging is the practice of making a detailed record (a well log) of the geologic formations penetrated by a borehole. The log may be based either on visual inspection of samples brought to the surface (geological logs) or on physical measurements made by instruments lowered into the hole (geophysical logs). Some types of geophysical well logs can be done ...

Von Mises Yield Criterion. The elastic limits discussed before are based on simple tension or uniaxial stress experiments. The maximum distortion energy theory, however, originated when it was observed that materials, especially ductile ones, behaved differently when a non-simple tension or non-uniaxial stress was applied, exhibiting resistance values that are much larger than the ones ...

Also, the wide application of oil-based drilling fluid may restrict the use of BFS for cementing operations. 2.2.2. Bentonite. Concentrated bentonite has been applied as material for P&A of oil and gas wells due to its ability to swell and its low permeability (Englehardt et al., 2001; Clark and Salisbury, 2003). The material has been tested and ...
