The line-oriented debugger DEBUG is an external command in operating systems such as DOS, OS/2 and Windows (only in 16-bit/32-bit versions). DEBUG can act as an assembler, disassembler, or hex dump program allowing users to interactively examine memory contents (in assembly language, hexadecimal or ASCII), make changes, and selectively execute COM, EXE and other file types.

New Technology File System (NTFS) is a proprietary journaling file system developed by Microsoft: Starting with Windows NT 3.1, it is the default file system of the Windows NT family. It superseded File Allocation Table (FAT) as the preferred filesystem on Windows and is supported in Linux and BSD as well. NTFS reading and writing support is provided using a free and open-source kernel ...

Introduction to librados . The Ceph Storage Cluster provides the basic storage service that allows Ceph to uniquely deliver object, block, and file storage in one unified system. However, you are not limited to using the RESTful, block, or POSIX interfaces. Based upon RADOS, the librados API enables you to create your own interface to the Ceph Storage Cluster.

Here we have declared a computed property reversedMessage. The function we provided will be used as the getter function for the property vm.reversedMessage:: console.log(vm.reversedMessage) // => 'olleH' vm.message = 'Goodbye' console.log(vm.reversedMessage) // => 'eybdooG'. You can open the console and play with the example vm yourself.

In the previous post in this series, we started to explore the internals of the Windows Console and Windows' Command-Line infrastructure. We also discussed many of Console's strengths and outlined its key weaknesses. One of those weaknesses is that Windows tries to be "helpful" but gets in the way of alternative and 3rd party Console developers, service developers, etc.
