(PDF) Distributed generation: definition, benefits and issues

Distributed generation takes place on two-levels: the local level and the end-point level. Local level power generation plants often include renewable energy technologies that are site specific, such as wind turbines, geothermal energy production, solar systems (photovoltaic and combustion), and some hydro-thermal plants.

Introduction to Distributed Generation

Distributed generation technology refers to power generation facilities on the customer side connected to a nearby LV grid or multigeneration systems for integrated gradient utilization (including wind, solar, and other distributed renewable power generation), multigeneration equipment for residual heat, residual pressure and residual gas generation, and small natural gas-fired systems with combined cooling and heating capabilities.
