A very general and useful rule: if the last part of your name is an actual compound then you are using substituent nomenclature (e.g., benzene, methane, butane, biphenyl, stannane, phosphine are compounds). Your name will be be one word.

Nomenclature in Organic Chemistry

What is IUPAC nomenclature? This is a method of naming the organic compounds as recommended by the international Union of Pure and Applied Chemistry (IUPAC). Each part of the IUPAC name gives you some useful information about the compound. Before starting the IUPAC rules, lets see an example of organic compound and it's IUPAC name.

2) Substitutive Nomenclature of Organic Compounds It is based on the approach where parent hydride is changed by replacement of hydrogen atoms with other atoms or a group of atoms. It is a system where we name the organic compounds using functional groups as the suffix or prefix to the name of the parent compound.

IUPAC NOMENCLATURE OF ORGANIC COMPOUNDS | RULES In the earlier days, the conventional names for organic compounds were mainly derived from the source of occurrence. However organic chemists realized the need for a systematic naming for organic compounds since a large number of organic compounds are synthesized in due course.

Organic compounds are defined by the presence of hydrogen-carbon structures. While hydrocarbons often refer to burnable compounds, the words mean pretty much the same thing. Naming complex organic compounds such as codeine or adenosine is difficult and will not be expected from high school or first year university students.

The naming of compounds containing mainly carbon and hydrogen (organic compounds) is called organic nomenclature. In order to have a universal way to name organic compounds around the world, the International Union of Pure and Applied Chemists (IUPAC) wrote a set of rules and guidelines followed by all organic chemist. There are a lot of terms to know like, functional groups, suffixes of names and basis names of parent chain.
