Unit 1: Similarity, Congruence, and Proofs This unit introduces the concepts of similarity and congruence. The definition of similarity is explored through dilation transformations. The concept of scale factor with respect to dilations allows figures to be enlarged or reduced. Rigid motions lead to the definition of congruence.

Once congruence is established, various congruence criteria (e.g., ASA, SSS, SAS) can be explored. Once similarity is established, various similarity criteria (e.g., AA) can be explored. These criteria, along with other postulates and definitions, provide a framework to be able to prove various geometric proofs.

### **UNIT 2: SIMILARITY, CONGRUENCE, AND PROOFS**

Using similarity, you are asked to find missing sides and angles. Homework 1 - If the angles fit they are congruent, if they don't they aren't. Homework 2 - These triangles are similar and the similarity statement is true. Homework 3 -  $\triangle DEF \sim \triangle ABC$  means that  $\triangle DEF$  is similar to  $\triangle ABC$ .

Similarity, like congruence, requires that two objects have exactly the same shape. For a similarity to exist, however, the dimensions need not be the same. There are a couple of implications here. The first is that, while two objects that are congruent must also, by definition, be similar, two objects that are similar need not be congruent.
